## Define in 1 or 2 lines and give one example

### **1. Recursive Relationship**

A recursive relationship is a relationship where something is connected to itself one record in a table is related to another record in the same table.

#### **Example:**

In an employee table, an employee can be a manager of another employee, so both employee and manager belong to the same table.

emp_id	emp_name	manager_id
1	ram	null
2	sita	1
3	arjun	1

### **2. Composite Key**

A composite key is a key that is made using more than one column together to uniquely identify a record

#### **Example:**

primary key (order\_no, product\_no)

orderno	productno	quantity
o101	p01	2
o101	p02	1

### **3. The 'like' operator with pattern matching**

The **LIKE operator** is used when we want to **search for data that looks similar to a pattern**, not exactly the same.

% → means **any number of characters**

- before the word
- after the word

- or both

**Example:** starts with a word

```
select * from client_master
where name like 'a%';
```

#### 4. Drop Table command

The DROP TABLE command is used to completely remove a table from the database

**Example:** drop table client\_master;

#### 5. Full Outer Join

A **full outer join** is used when we want **all records from both tables**, whether they match or not

**Example:**

Employee			Department	
emp_id	emp_name	dept_id	dept_id	dept_name
1	ramesh	10	10	hr
2	suresh	20	20	it
3	anita	30	40	finance

```
select e.emp_id, e.emp_name, d.dept_name
from employee e
full outer join department d
on e.dept_id = d.dept_id;
```

emp_id	emp_name	dept_name
1	ramesh	hr
2	suresh	it
3	anita	null
null	null	finance

## JOINS

--Find out the products, which have been sold to 'Ivan Bayross'

```
select distinct sod.productno, pm.description
from client_master m
